INTRODUCTION

PROBLEM STATEMENT

1 A significant gap between professional e-hailing services and informal ride-sharing methods

2 Manual ridesharing through social media is unregulated and lacks essential features such as GPS tracking and reliable matching algorithms, making it inherently unsafe and disorganized

OBJECTIVES

1 Utilize AI route-matching algorithms to connect passengers and drivers with similar routes

2 Implement a robust safety framework including user verification, real-time GPS tracking, and AI-based monitoring to build user trust

3 Facilitate a pricing system that allows students to bargain for affordable rides and provides drivers with a platform for side income.

TIMELINE

MILESTONE 3: PROJECT DELIVERED																

PLANNING

EXISTING SYSTEM FDD

PLANNING

PROPOSED SYSTEM FDD

**AI-Powered Matching
Formalized Negotiation System
Safety Infrastructure
Centralized Mobile Interface**

ANALYSIS

QUESTIONNAIRE RESULT

Distribution of Student Residential Status

Only 35% student are reported owning a personal transportation

spending between RM150 and RM300 per month on transportation

73% who own vehicles indicated that they usually travel alone and would be willing to offer rides

Transportation

DESIGN

ERD

CONCLUSION

1

A comprehensive understanding of the transportation challenges faced by university students

2

Further research is necessary to optimize the AI matching algorithm for increasingly complex traffic patterns

3

Students can enjoy safer, more cost-effective, and environmentally friendly commuting options, while student drivers gain supplementary income opportunities.
